

CYBER THREATS DON'T SLEEP. NEITHER DO WE.

BUSINESS INSIGHT

SEC-FIN-OPS

Every application, cloud workload, security control and digital service influences more than your technology environment.

Explore the Sec-Fin-Ops approach

Technology Decisions Are Now Business Decisions.

Every application, cloud workload, security control and digital service influences more than your technology environment.

It affects operational performance, cybersecurity risk, customer experience and business costs.

Yet most organisations still manage these areas separately.

Operations focuses on uptime.

Security focuses on threats.

Finance focuses on budgets.

Each team sees only part of the picture.

The result is slower decisions, conflicting priorities and missed business risks.

SecFinOps helps organisations connect these perspectives, giving business and technology leaders the context they need to make faster, smarter decisions.

Technology Has Become Too Complex To Manage In Silos.

Modern Technology

Hundreds of connected applications, cloud services, APIs and third-party platforms.

Multiple Perspectives

Operations, Security and Finance each see the same event differently.

One Incident

A single technical change can impact multiple business functions.

The Real Challenge

Disconnected decision-making slows response and increases business risk.

One Incident. Three Different Conversations.

Operational View	Security View	Business View
Is the application slowing down?	Is this malicious activity?	How much revenue is at risk?
Why has cloud usage increased?	Has an account been compromised?	Is this additional spending justified?
Why did infrastructure change?	Was this an unauthorised change?	What is the financial impact of recovery?

When every team works from different tools and different data, organisations spend valuable time trying to understand the problem before they can solve it.

What Is Sec-Fin-Ops?

Sec-Fin-Ops is a business operating framework that **connects security, finance and operations into one decision-making model.**

Instead of treating performance, cyber risk and technology spend as separate conversations, organisations evaluate them together.

This allows leaders to answer questions that individual teams cannot answer alone.

- What changed?
- Why did it happen?
- Is it a technical issue or a cyber incident?
- Which customers or business services are affected?
- What is the financial impact?
- What should we do next?

Sec-Fin-Ops shifts the conversation from managing technology to managing business outcomes.

How Cybots Brings Sec-Fin-Ops To Life

Technology alone cannot deliver Sec-Fin-Ops.

It requires visibility, context and expertise.

Cybots combines unified observability, managed cybersecurity services and advisory expertise to help organisations connect technical events with business impact.

Unified Visibility

Correlate operational, security and financial signals across the technology environment.

Business Context

Prioritise incidents based on business impact while improving cyber resilience and reducing unnecessary technology costs.

Smarter Decisions

Give leaders the visibility and expertise needed to respond faster and make confident business decisions.

Instead of reacting to isolated alerts, leaders gain a complete understanding of what is happening, why it matters and what action should come next.

Why Organisations Are Adopting Sec-Fin-Ops

Improve Technology Investment

- Understand where technology spending delivers business outcomes and where it creates unnecessary cost.

Reduce Business Risk

- Prioritise security investments according to actual business exposure rather than technical severity alone.

Respond Faster

- Give operations, security and business teams a shared understanding of every incident.

Strengthen Business Resilience

- Reduce the likelihood that operational issues become financial, reputational or customer crises.

Align Business And Technology

- Create a common operating model where technology decisions support business objectives.

Technology Is No Longer Just An IT Function.

Technology no longer impacts IT alone. Every decision affects operational performance, cybersecurity and financial outcomes. With Sec-Fin-Ops, organisations gain the clarity to make smarter decisions, respond faster and strengthen business resilience.
